

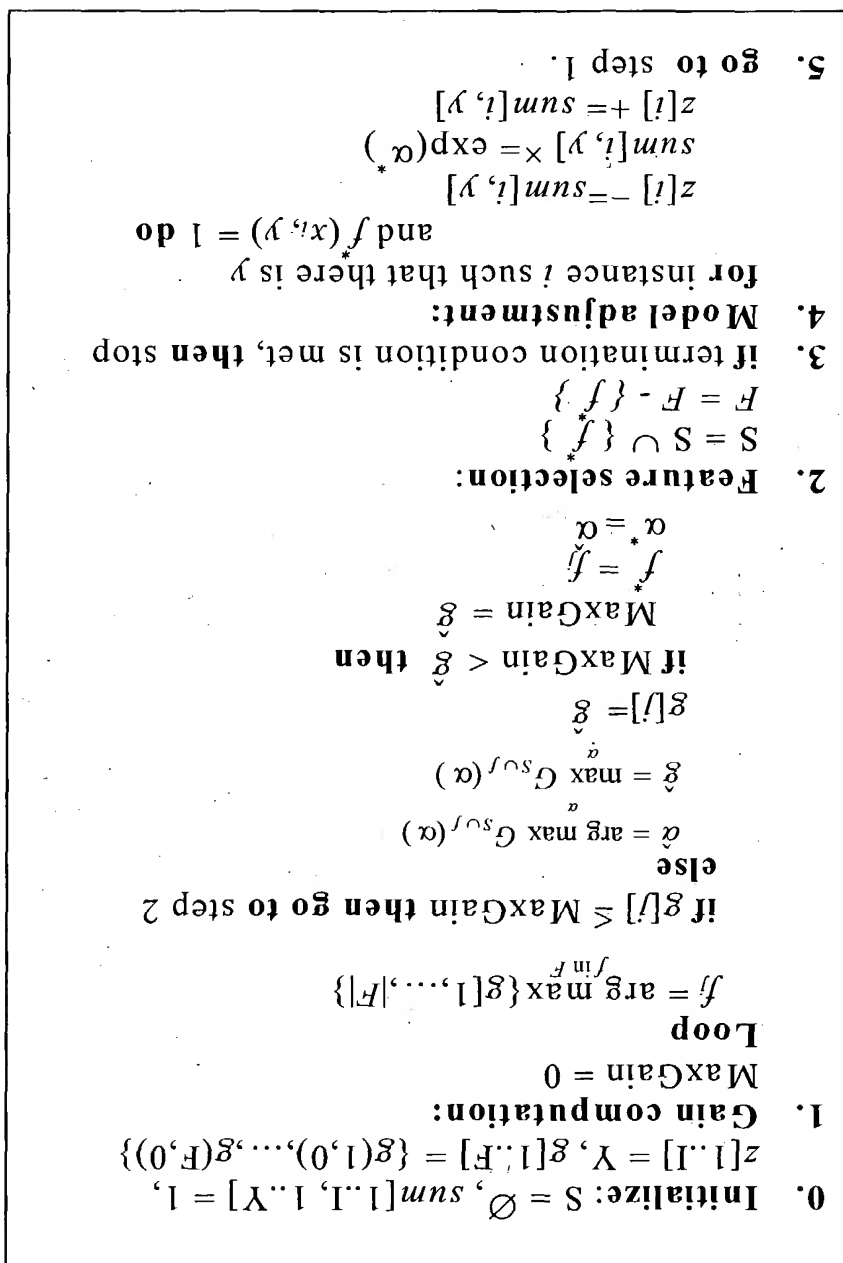

Figure 1

0. Initialize: $S = \emptyset, sum[1..I, 1..Y] = 1, z[1..I] = Y$
1. Gain computation:
 $MaxGain = 0$
for f **in** feature space F **do**
 $\hat{\alpha} = \argmax_{\alpha} G_{S \cup f}(\alpha)$
 $\hat{g} = \max_{\alpha} G_{S \cup f}(\alpha)$
if $MaxGain < \hat{g}$ **then**
 $MaxGain = \hat{g}$
 $f_* = f$
 $\alpha_* = \hat{\alpha}$
2. Feature selection:
 $S = S \cup \{f_*\}$
 $F = F - \{f_*\}$
3. **if** termination condition is met, **then** stop
4. Model adjustment:
for instance i such that there is y
 $and f_*(x_i, y) = 1$ **do**
 $z[i] -= sum[i, y]$
 $sum[i, y] \times = \exp(\alpha_*)$
 $z[i] += sum[i, y]$
5. **go to** step 1.
